

ABSTRACT OF THE DISCLOSURE

A reconfigurable pallet that supports a structure includes a pallet base and at least one track formed in the pallet base. A plurality of modular stanchions are supported on the pallet base and slidably engage the at least one track to selectively position the modular stanchions along x and y axes relative to a top surface of the pallet base. The modular stanchions each include a support element that has a height along a z axis that is transverse to the x and y axes. The support element supports the structure.
